

Calibration History of a Shadowband Instrument Measuring Aerosol Optical Depth

Presented at the

Aerosol Optical Depth Comparisons and Workshop
PMOD/WRC

Davos, Switzerland

25 September to 13 October 2000

K. Larman, F. Denn
Analytical Services & Materials, Inc.
Hampton, Virginia
USA

In support of NASA Langley Radiation & Aerosols Branch

Introduction

Instrument Description

Theory of Operation

Filter Spectral Response

Cosine correction

History filters & calibration

Summary

Instrument Description

Yankee Environmental Systems, Inc. MFRSR-7

Heated silicon sensors : SI, 416nm, 502nm, 616nm, 671nm, 870nm, 938nm

Diffuser alternately shaded and un-shaded, provide global and diffuse data.

Direct beam is calculated by $global = diffuse + \cos(Z) \text{ direc}$

Autonomous, field deployable.

Theory of Operation

Rearrange Bouguer Law : $\ln(V) - \ln(V_0) = - \text{TAU}$, $6 \leq \text{Air Mass} \leq 2$

Linear regress multiple measurements

Harrison's Objective Algorithm

- 1) find where $dV/d(\text{air mass})$ is positive- cloud activity ; remove data
- 2) check second derivative
- 3) two linear regressions, remove points $>1.5 \text{ SD}$ from first regression line
- 4) final linear regression yields coefficients V_0 and TAU

Track V_0 , incorporate into calibrations for Aerosol Optical Thickness.

Compared to a CIMEL at same site to .01 units

Summary

Operated the 379 MFRSR-7 at MLO (~3000m), at LaRC (SL), COVE (SL)

Found the least variability in data at MLO and most at COVE

Compared well with a co-located CIMEL unit

Changed to IAD filters

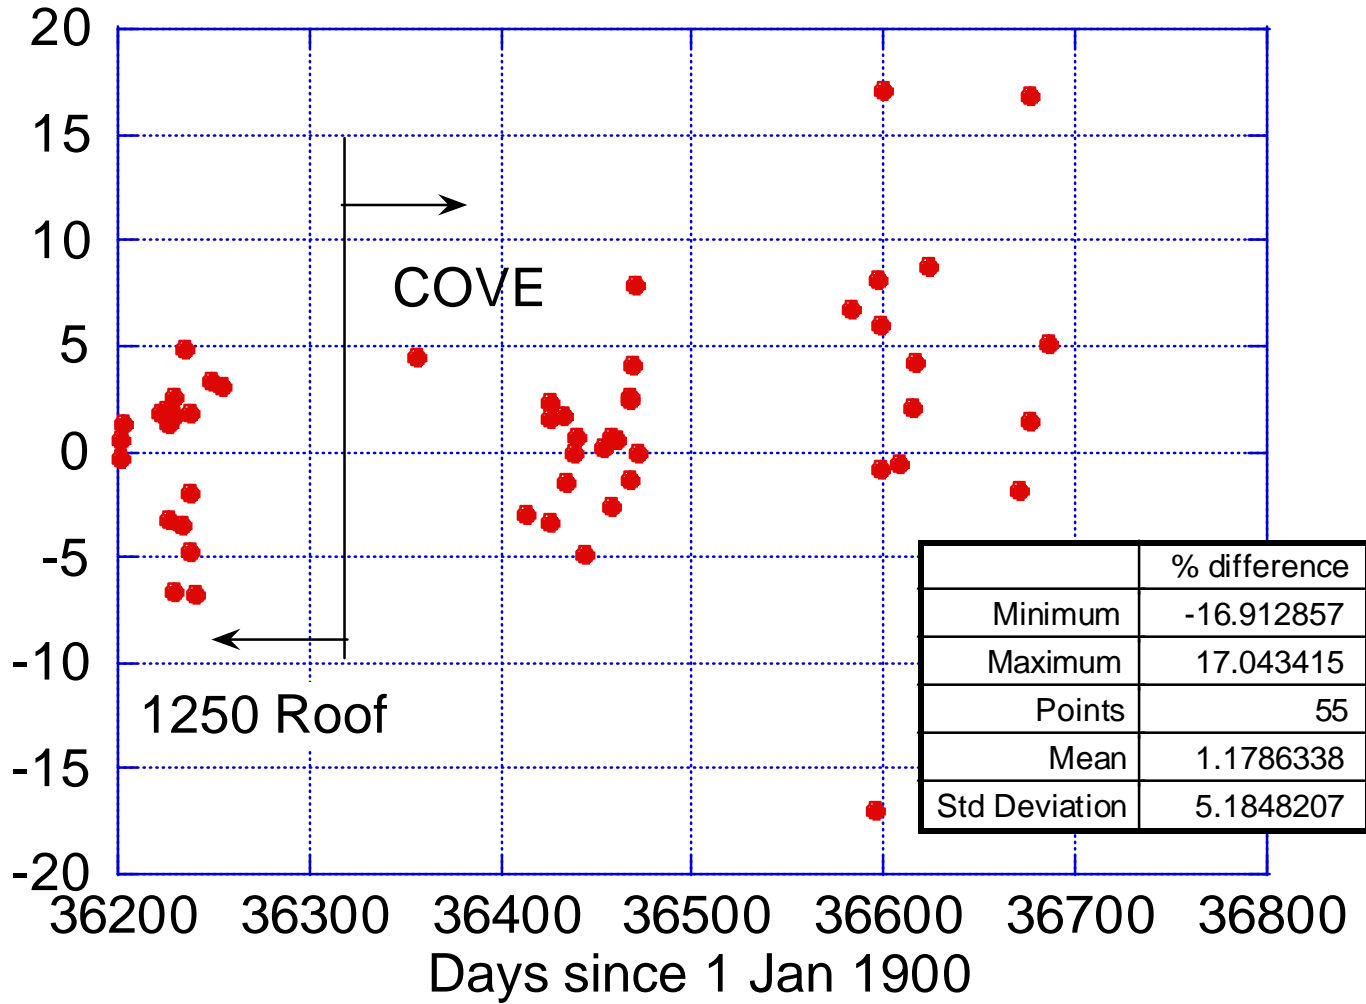

Plan to rotate sensor head between MLO, LaRC and COVE to track V_o .
